**Notes:**

- The census block is the unit of analysis
- The model presented here was performed on HAZUS-MH (courtesy of FEMA) through ArcGIS 9.1 (ESRI, Inc.).
- This model only incorporates damage and loss estimates from hurricane winds and does not account for freshwater flooding or storm surge events that can occur during a hurricane event.
- The results presented here are one possible group of outcomes taken from an infinite number of event scenarios and therefore neither fully represent nor exhaust the range of possible outcomes from a hurricane event in the analysis area.
